Abstract
In order to comply with the different regulations and commitments requesting the presence of scientific observers onboard French purse seiners, and since it is not possible to embark more than one observer during a fishing trip, ORTHONGEL has imagined and implemented since July 2013 a program to facilitate and optimize the boarding of well-trained scientific observers. This voluntary program, called OCUP for “Observateur Commun Unique et Permanent” (Common Permanent Unique Observer) was conducted with the Institute for Research and Development (IRD), Oceanic Développement (OD) and several coastal countries. It was implemented in both Atlantic and Indian Oceans where the fleet adherent to ORTHONGEL is active. This paper describes the methodology of the OCUP program and presents and discusses its main results, focusing on the Atlantic Ocean.

In the Atlantic Ocean, 43 scientific observers from 6 African countries have been trained as OCUP. Together with 39 French observers from IRD and OD, 37 of these African scientific observers have covered more than 300 trips until September 1st, 2017 and the coverage of the French fleet has reached 100% since 2015. Since 2013, the OCUP program allows a better coverage of many fishing information such as bycatch or incidental catch and discards data but also provides the boat-owners information on the implementation of best practices aboard their vessels. Lessons learned from this program allow the authors to suggest a few recommendations.

Résumé
Afin de satisfaire aux différentes régulations et aux différents engagements pris par la flotte française de thoniers senneurs tropicaux, et puisqu’il n’est pas possible d’embarquer plus d’un observateur par marée, ORTHONGEL a imaginé et mis en place depuis 2013 un programme pour faciliter et optimiser l’embarquement d’observateurs scientifiques de bonne qualité. Le programme volontaire, appelé OCUP (Observateur Commun Unique et Permanent) a été développé en collaboration avec l’Institut de Recherche pour le Développement (IRD), Oceanic Développement (OD) et plusieurs pays côtiers. Le programme a été mis en place dans les océans Atlantique et Indien où est active la flotte de senneurs adhérente d’ORTHONGEL. Ce document décrit la méthodologie du programme OCUP et présente et discute ses principaux résultats, en se concentrant sur le cas de l’Océan Atlantique.

Dans cet océan, 43 observateurs de 6 pays Africains ont été formés comme observateur OCUP. En complément des 39 observateurs français employés par l’IRD et OD, 37 de ces observateurs africains ont réalisé plus de 300 marées d’observation à ce jour et le taux de couverture des marées observées a atteint 100% en 2015. Depuis 2013, le programme OCUP permet une meilleure couverture de nombreuses informations telles que les prises accessoires, les prises accidentelles d’espèces sensibles ou encore les rejets. Le programme fournit également aux armements des informations utiles sur le respect des bonnes pratiques à bord. Sur la base du retour d’expérience du programme, les auteurs formulent quelques recommandations.

1. Introduction

The use of onboard scientific observers to monitor the activities of fishing vessels and collect fishing data for scientific purposes (i.e., stock evaluation) is requested for by international law (art. 62 of UNCLOS, 1982), by the FAO guidelines for the promotion of responsible fishing practices (art. 84.3 of the FAO Code of Conduct for Responsible Fisheries, 1995), as well as by ICCAT recommendations (Rec. 10-10, Rec. 15-01). In the case of the tropical tuna purse-seine fishery which activities take place in several EEZs, the flag State as well as several coastal countries (through fishing agreements) are therefore requesting the boarding of observers on board French purse seiners. In addition, the degree of accuracy of catch and discard data to be reported in logbooks is such that the presence in the crew of an observer collecting such information provides a useful assistance to skippers. Finally, the need for transparency and/or certification of the catch (e.g., FAD-free certificates) has brought French shipowners to consider having accredited observers permanently onboard.

As it is not possible to embark more than one observer at a given time, ORTHONGEL has imagined and implemented since July 2013 a program to facilitate and optimize the boarding of scientific observers able to fulfill most of the tasks requested by the above-mentioned regulations or commitments taken by the French fleet. This voluntary program, called OCUP for “Observateur Commun Unique et Permanent” (Common Permanent Unique Observer) was conducted in collaboration with the French Institute for Research and Development (IRD), Oceanic Développement (OD) and BIGEYE SARL (BE) and funded by ORTHONGEL, France Filière Pêche (FFP) and French canneries for the program coordination and the observation of fishing trips in complement of trips covered by Data Collection Framework (DCF, funded by EU) and by national observers (in charge of the national administrations). The program was (and is still) implemented in both the Atlantic and Indian Oceans where the purse seiners of the adherents to ORTHONGEL are active. Its general objective is to address the requests of different origins with potential different contents in terms of observation aboard French purse seiners: (i) IRD for mandatory (EU Data Collection Framework – DCF, R(CE) 199/2008) or supplementary scientific data collection, (ii) French administration in compliance with RFMOs’ regulations, (iii) coastal States in compliance with fishing agreements obligations (Sustainable Fisheries Partnership Agreement –SFPA – signed with EU or private agreements signed with ORTHONGEL), and (iv) shipowners to certify commitments made in the frame of responsible fishing schemes.

Actions consisted in:
- defining with other stakeholders (participating flag and coastal States fisheries administrations and scientific institutes) the priorities and conditions of boarding to guaranty the security, reliability and independence of scientific observers in accordance with minimum standards for scientific observer programs established later by ICCAT Rec. 16-14;
- setting a coordination for a permanent boarding of observers on all French purse seiners;
- elaborating and providing a specific training for national observers from (and designated by) coastal countries willing to participate;
- implementing procedures to board, manage and debrief observers as well as collect, verify and archive validated data and establishing access rules to the archived information;
- implementing tools to communicate mandatory data and reports to relevant fisheries administrations (flag State, coastal State mandating the observer or coastal States which EEZ were visited during the fishing trip) and scientific institutes.

For the Atlantic Ocean, participating coastal countries were initially Ivory Coast, Senegal and the Republic of Guinea, joined later by Gabon, Mauritania and São Tomé and Príncipe. More information on this program is available on http://www.orthongel.fr/ocup.php.

Here, it must be noted that the OCUP could be considered as scientific or transparency observers but, in line with the recommendations made by the ICCAT Scientific Committee (SCRS), should not be considered as controllers. It is however clear and accepted by French skippers and shipowners that data collected by
national scientific observers could be used in case of possible litigation, as a consequence of transparency. The word “OCUP” is thereafter used only to refer to scientific observers trained within the OCUP framework. Independently of the funding, all fishing trips covered by OCUPs (DCF, moratorium, national observers or observers embarked to complement the coverage to 100%) were coordinated by the program.

This paper aims to describe the methodology of the OCUP program and presents and discusses its main results, focusing on the Atlantic Ocean. Observer data collected since 2013, that contains detailed and specific information available to scientists on the major catch (skipjack, yellowfin, bigeye and albacore tuna), bycatch (minor tunas and finfishes that could be landed, including discards) or incidental catches (sharks, rays or turtles not wanted by fishermen, including releases of alive individuals) are only briefly analysed here.

2. Methodology of the OCUP program

2.1. General organization of the program

The OCUP program started first through a trial period (from July 1st, 2013 to December 31st, 2014) and is routinely implemented since January 1st, 2015. It involves (i) a group of well trained scientific observers originating from the flag State (France) or coastal countries where tropical tuna fishing occurs (e.g. Ivory Coast, Republic of Guinea and Senegal) and (ii) a steering committee dedicated to:

- set up the ad hoc organization for the optimal implementation of observer boarding in coordination with the shipowners, the IRD and coastal countries administrations (Ministry and Fisheries Monitoring Centre);
- check the quality of the information collected during observed fishing trips and computerized, and if necessary, indicate the corrective actions to be implemented;
- evaluate and improve the proper implementation of the program with the cooperation of all involved stakeholders (observers, fishermen, managers and scientists).

To achieve these goals, the steering committee relies on a consortium involving OD based in France (in charge of the general coordination) and BE (in charge of the regional coordination) based in Abidjan (Ivory Coast) where purse seiners are usually calling. The steering committee is composed of representatives of ORTHONGEL, IRD, OD, BE and open to representatives of the flag and coastal States. The steering committee meets regularly and yearly regional meetings with representatives of the flag and costal States are organised. Since July 2013, the steering committee met 12 times and 6 regional meetings with coastal countries’ administrations were organised (often during RFMOs plenary meetings).

This scheme allows the participation of all stakeholders and the transparency and a continuous improvement of the program. Tables 1 and 2 summarize the involvement and role of each stakeholders. A similar scheme was also set up in the Indian Ocean.

2.2. Training of observers

Observer recruitment / designation

OCUP candidate are nominated by relevant fisheries administrations for national observers or selected by the steering committee from their curriculum vitae for other observers. All potential observers are then evaluated by the steering committee based on the criteria listed in table 3. Information on their education level and professional experience are scored from 1 to 5 for each criterion and candidates having a total score of 45 or more are selected for a training session.
Organisation and content of the training

Two training sessions have been organised in the Atlantic Ocean (May 2014 and November 2016). The regional coordinator is in charge of organising each 2-week training session. Training sessions took place in Abidjan and 10 to 12 OCUP candidate from coastal countries were trained per session. The content of OCUP training sessions is summarized in Table 4. The objective of the training session is also to be attentive to the behaviour of the participants (participation, interest for the program, sociability) to evaluate their ability to become integrated onboard during their first fishing trip.

Evaluation of observers

During the training session, each candidate observer is tested on various skills and knowledge: this includes a writing test (to evaluate French language skills, handwriting legibility as well handwriting speed), a form filling test (to test the speed of candidates when filling the forms and their ability to fill the different fields appropriately), a data entering test (to test the speed of candidates when using the software ObServe (Cauquil et al., 2015), their understanding of the different fields that should be filled as well as their computer skill), a species identification test (to make sure they will recognise the main catch, bycatch and incidental catch species), and a questionnaire on the program background and the tuna RFMOs recommendations. At the end of the training session, a personal interview takes place with candidate observers to discuss the results of the tests and confirm the impression given by the candidate. An evaluation form is filled with information on the results of the tests, the behaviour of the candidate observer during the training session (including his attendance during the training session and his motivation) and results of the personal interview.

The first trip of the observer on a purse seiner is also considered as a test and a questionnaire is provided to the captain of the purse seiner to evaluate his satisfaction regarding the work and the behaviour of the OCUP during the fishing trip. The information collected in the questionnaire are then transmitted to the regional coordinator and the steering committee. When both tests are successful, an “OCUP” certificate is delivered by the PCT to the observer. Since 2017, the observer receives a “fisheries observer individual passport” gathering all information on his/her training sessions, accreditations and work experiences as observer.

On one hand, this allows managers and fishermen to measure the quality and the reliability of the observer and, on the other hand, this valorises and professionalises the job of fisheries observer.

2.3. Coordination of observed fishing trips, boarding of observers and debriefing procedures

The boarding of OCUPs on tuna purse seiners to collect information on fishing activities is the most important part of the OCUP program. To ensure that observer boarding take place in the best conditions possible, a number of specific steps involving different actors must be followed. The identification of these steps as well as their practical implementation was one of the main results of the experimental phase of the OCUP program (2013-2014).

The sequence of steps in the observer embarkation process is described in Table 1. A live document (called OCUP Vademecum) was compiled and is continuously improved to gather protocols and reference documents for all steps of the scheme.

The coordination of observed fishing trips is ensured by the steering committee at the end of each year for the following year. It takes into account the provisional fishing trips dates provided by shipowners, the regulation constraints (ICCAT moratorium, DCF), the availability of OCUPs from flag and coastal States and the level of catch in each EEZ (to weight the number of fishing trips observed by national observers of the different coastal countries). The “provisional calendar of observed fishing trips” is communicated to each stakeholder and endorsed by coastal States through the communication of official observer schedules to EU (in the case of SFPAs) or ORTHONGEL (in the case of private agreements).
2.4. Observer tasks and data collection

Each OCUP fill 5 forms, designed by OD and IRD (annex 1):

- Form A provides information on the position of the purse seiner, EEZ entry and exit notification, environmental information (e.g. temperature, currents) and information on the surrounding activities (other fishing vessels in the area and gear type type);
- Form B provides information on fishing activities (e.g. bycatch, discard and incidental catch estimates per species);
- Form C1 and C2 provide information on tuna and bycatch species size sampling performed by the OCUP;
- Form D provides information on floating objects (FOB) including the type of FOB (e.g. dFAD or tree log), the activity on the FOB (e.g. visit, deployment, retrieval) and the activity on the tracking buoy (e.g. deployment, exchange);

These forms (similar to those filled by other observers aboard EU tropical tuna purse seiners) are filled on paper and electronically by the OCUP during the fishing trip and directly stored in the dedicated IRD ObServe database using the ObServe software (http://www.ob7.ird.fr/mot/observe).

In addition to data collection, OCUPs should also assist purse-seine captains in reporting mandatory information on fishing activities (e.g. logbook data, Electronic Recording and reporting System – ERS).

Although OCUPs are not controllers, they are asked to report to the regional OCUP coordinator any type of activity that do not comply with tropical tuna fishing regulations: ORTHONGEL decisions (e.g. ban on shark finning, deployment of non-entangling FADs, ...) or ICCAT recommendations (e.g. fishing set on marine mammals, discards of small tunas, fishing set on a FOB within the moratorium). The regional OCUP coordinator is in charge of relaying this information to OD and Orthongel (and when mandated by a country to their authorities). OCUPs are also asked to provide information on potential IUU fishing.

Since ORTHONGEL implemented several programs\(^1\) to reduce the potential environmental impact of tropical tuna purse seining, OCUPs are asked to report on the correct implementation of the “best practices” and to suggest potential improvements in a dedicated form. They also report that only non-entangling dFADs are used by purse seiners in a specific form.

Finally, research institutes of coastal countries may require additional data collection or sampling. Provided that the data/sample collection protocol has been validated by the steering committee of the OCUP program, OCUPs are in charge of collecting these additional data/material.

For all the tasks described here-above, OCUPs fill out paper forms but also input electronically the different data on board using a laptop provided by the program and the ObServe software which allows various validations of the data.

2.5. Reports and data sharing

Observers are in charge of drawing up a report for each trip. Report templates and Excel files generating standardised analyses and graphs are provided by OD and the regional coordinator. The ObServe database can also be used to generate standardised tables.

The national observer can keep paper forms to transmit them to the fisheries administration that mandated him/her. In this case all forms are scanned during the debriefing. Else, the paper forms are stored by the

---

1. The programs “Tuna Contract for the Future- Sharks” (2011-2012) and "Tuna Contract for the Future-Selectivity" (2013-2015) initiated by ORTHONGEL in collaboration with the IRD aimed at reducing the mortality of sensitive species such as sharks, rays and turtles caught incidentally by purse seiners (Poisson et al., 2012; Poisson et al., 2014). During this program, vessel crews were trained to release sharks and rays alive. The “Tuna Contract for the Future ecoFAD” (2011-2012) aimed at eliminating the entanglements of sea turtles in the surface structure (Goujon, 2015) and sharks in the underwater structure of dFADs (Goujon et al., 2014). Since 2013, 100% of entangling dFADs have been replaced with a non-entangling design in the Atlantic Ocean (ORTHONGEL decision n°11, 23th November 2011).
regional coordinator. Data are transferred to IRD Observe database and reports are stored on a server allowing all authorised persons (designated by the flag and coastal States administration and ORTHONGEL) to download the reports. The url of this server called Obsweb is [https://www.obsweb.org/ocup/](https://www.obsweb.org/ocup/).

Three types of reports are produced:

- a short summary with general information related to the observed fishing trip (date and port of departure and landing, number of fishing sets, tuna catch, information on the purse seiner and the observer, problems encountered by the observer and infraction suspicion when applicable);
- a full report with tables and graphs summarising the information collected on fishing activity, tuna catch, bycatch, discards when applicable, activity related to FADs, at sea observations, species size measurements, ...;
- for each EEZ visited, a “EEZ report” with the same tables and graphs than the full report but only for the information collected in the relevant EEZ.

In addition, specific reports were produced to the French fisheries administration (DPMA) for the periods of FAD moratorium in compliance with ICCAT Recommendations. Access to data and these different reports is conditioned by the legitimacy to access these data as described in table 2.

3. Results

3.1. Number of observers and coverage

Since July 2013 and up to June 2017, 43 scientific observers from 6 African countries have been trained as OCUP (table 5). 25 of these observers are employed by BE and the remaining 18 are national observers designated by the 6 countries (Ivory Coast, Senegal, Republic of Guinea, Gabon, Mauritania and São Tomé and Príncipe). Unfortunately, 6 of the trained national observers did not embark onboard a French vessel (as a decision of their administration); some have been missioned by their administration to embark on other fishing boats (in the case of Senegal and Republic of Guinea).

Together with the 39 French observers from IRD and OD (already or newly trained who are working either in the Atlantic Ocean or in the Indian Ocean), the 37 African observers have covered 307 trips since the beginning of the OCUP program (table 6) including 10 trips on the French support vessel (during moratorium periods). 91% of these trips were observed by BE observers, 3.6% by national observers and 4.9% by French observers.

From 2013 to 2017, 12.0% of the fishing trips were observed under the EU DCF program (*i.e.* above the mandatory minimum 10% fixed by the EU legislation), 26.4% of the trips were observed during the area/time closure for the protection of juveniles of yellowfin and bigeye tunas (ICCAT Rec. 11-01, 13-01, 14-01, 15-01 and 16-01), 3.6% of the fishing trips were observed in application of the provisions of the fisheries agreements and 61.6% of the trips were observed on a voluntary basis in order to cover 100% of the activity of French vessels (trips referred as “complement”). 11 fishing trips realized under the EU DCF program during the moratorium were counted twice in these percentages (table 6).

During the first months of the program, French OCUPs were boarded in order to test and validate the OCUP program protocols. In the meantime, BE observers were trained and quickly started to embark onboard French purse seiners so that in 2014, the coverage of the fleet was almost 100%. Although national observers were trained in 2014, legal (and possibly funding) issues prevented the boarding of these observers. Some of them were however missioned by their authorities as fisheries observers on local vessels. It is only after 2 years of promotion of the program and the training of a new group of national observers that trips covered by national observers started to increase (table 6, figure 1). Considering the increase in the number of countries involved in the coordination of the program and their increasing motivation, it is expected that such fishing trips will become predominant in the coming months.
In terms of number of days, the coverage of the French fleet (only purse seiners) increased from an average of 13.5% before 2013 to 46.4% in 2013 (54.3% for the period when the OCUP program was implemented i.e. from July 1st), 96.3% in 2014 and 100% since then (table 7, figure 2).

### 3.2. Observer reports

To this date, reports have been validated for 306 of the 307 observed fishing trips (one national observer trained in his country did not input data in ObServe during his trip). In addition to the 306 full reports and 306 short reports available on Obsweb, 444 EEZ reports (table 8) were compiled (as well as 193 reports for the sole international waters).

In addition, 42 reports were produced for the French administration for the periods of the FAD-fishing moratorium (January 1st at 0:00 to March 1st at 0:00) in compliance with ICCAT Rec. 11-01, 13-01, 14-01 and 15-01.

### 3.3. Data collected

The idea in this chapter is not to analyse the data collected but just to give a quick overview of the type and amount of data collected by OCUPs in addition to the data collected under the DCF program or during the moratorium periods (national observers and observers boarded as a complement to reach 100% coverage). Detailed analysis will certainly be conducted in the future by scientists of IRD and/or coastal States research institute to explore the information contained in these data and compare them to data collected under the DCF program or during the moratorium periods.

**Catch and bycatch data**

As other observers aboard EU purse seiners, OCUPs follow a standardised protocol that allows estimating bycatch, discards and incidental catches per species. As part of the protocol, observers are in charge of sampling a fraction of bycatch species (that can be measured and/or weighted on board) and use these samples to extrapolate to a total number of fish per species. From 2013 to 2017, a total of 17 438 samples have been made by OCUPs in the Atlantic Ocean (75.3% of all samples made during all observer programs) and 326 940 fishes were measured and/or weighted (74.3% of all individuals manipulated during sampling operations).

Bony fish (other than tunas and billfishes) represented the majority of individuals sampled by OCUPs from 2013 to 2017 (68.5% of individuals, figure 3) followed by non-target species of tunas (15.0%) and skipjack tuna (9.4%). Sharks species represented a significant fraction of individuals of sensitive species (2.4% of the total number of individuals sampled by OCUPs) with species such as the silky shark *Carcharhinus falciformis* (72.8% of sampled sharks), other Carcharhinidae species (8.2%), the scalloped hammerhead shark *Sphyra lewini* (6.9%) or the smooth hammerhead shark *Sphyra zygaena* (3.4%). Note that measurements of alive individuals of sensitive species such as sharks, rays, whale sharks or sea turtles have been made following ORTHONGEL/IRD’s best practices.

Individuals sampled or observed by OCUPs were then used to estimate the total number of individuals caught during a given fishing set using raising factors. From 2013 to 2017, the program OCUP contributed for example to 62.9% of bycatch estimates of billfishes, 65.9% of bycatch estimates of bony fishes (other than tunas and billfishes), 84.4% of bycatch and release estimates of sharks and 85.0% and 85.7% of observations of whale sharks and cetaceans respectively.
Fishing sets and observations at sea data

During observed fishing trips, OCUPs are also in charge of reporting the different activities of purse seiners (successive positions of purse seiners, tuna school detections, activities on FOBs and observations of megafauna) in addition to information on fishing sets. From 2013 to 2017, a total of 114,994 activities (67.6% of all activities reported by observers of all programs) and 5,701 fishing sets (70.2% of all fishing sets reported by observers of all programs) have been reported by OCUPs. All large proportion of the activities reported by observers only consisted of reporting the position of the purse seiner (36.6%, figure 4), followed by observations of FOBs (17.4%), observations of other fishing and support vessels (16.9%) and observations of tuna schools (15.4%). In addition, observations made by OCUPs provided information on marine mammals (1.3% of observations), marine birds (7.9%), sharks or whale sharks (0.2%). The position of the different types of observations was also reported (figure 5) providing useful information to increase the amount of spatial data available from observer programs.

4. Discussion and conclusions

4.1. An innovative international cooperation

The OCUP program is the first of its kind: previous programs concerned either national observers boarded by the flag State or regional observers boarded mandated by a regional organisation (e.g. ICCAT transhipment observer program). Harmonizing the skills and work of national observer from flag and coastal States seems the best way to address all needs of observation on the “straddling” tuna purse seiners. With such a scheme, each country is able (i) to have at least once a year a national observer onboard one of the French purse seiners and (ii) to make sure that every time a French purse seiner is in its EEZ, an observer is present aboard to collect standardized data. Although the reliability of OCUP scientific observers can easily be acknowledged based on transparent procedures, it is however necessary that countries agree on the legal acknowledgment of common observers i.e. (i) each country mandated an OCUP onboard a purse seiner accept that data collected by this observer in the EEZ of another country is reported to this other country and (ii) each country recognizes the validity of the report of data collected in its EEZ by an OCUP mandated by another country. During regional meetings of the steering committee with administrations of coastal States, it was concluded that the easiest way to obtain this multilateral agreement would be through the accreditation of such common observers by the RFMO. Such accreditation would be based on minimum standards in terms of skills and training of national observers such as in the OCUP program to guaranty a continuous quality and reliability of data collected.

4.2. Increased observer coverage

One of the main successes of the OCUP program was to increase the coverage of French tropical tuna purse seine fishing trips both in the Atlantic and Indian Oceans. Before the implementation of the program fishing trips were only covered within the EU – DCF framework and during ICCAT moratoria. The objective was to cover a minimum of 10 % of fishing trips (DCF) to comply with ICCAT Rec 10-10 and to ensure that fishers complied with closed areas (ICCAT moratoria). Since 2013, the coverage of fishing trips has quickly increased in the Atlantic Ocean to reach 100% in 2015. This increased coverage did not only allow covering 100% of fishing sets and activities of purse seiners in order to improve the transparency of the fishing fleet but also provided increased amount of information on the activities of purse seiners, encounters of marine mammals or whale sharks and catch, bycatch or incidental catch of sensitive species. In the future, this large amount of information should open new perspectives to scientists, in particular to improve estimates of bycatch and discards for tropical tuna purse seine fleets.
Acknowledgements

The authors would like to thank the French skippers and crews and the shipowners member of ORTHONGEL for their contribution to the OCUP program and for their efforts to facilitate the living and the work conditions of OCUPs on the French purse seiners. We also thank all OCUPs for having done their job properly without interfering with the crew activities. A special thank is addressed to the administrative persons of the coastal States that contributed by their suggestions and support to the success of the program. Finally, we embrace in our thanks the French tuna canneries and France Filière pêche which contributed financially and promoted the program.

(1) IRD and national research institutes of involved coastal States (CRO, CRODT, CNSHB)
(2) French DPMA, CROSS, DG MARE, Ministries in charge of fisheries and Fisheries Monitoring Centre of coastal countries, each responsible for their national observers
(3) ORTHONGEL and the boatowners
(4) Mandatory observers in compliance of EU DCF and ICCAT recommendations 13-01, 14-01, 15-01 and 16-01
(5) When an observer suspects an infraction, a contradictory debate is organised by the regional coordinator prior to any notification, although observers have the possibility to communicate at any time with their administration.
(6) Reports are sent to boatowners for them to check that irrelevant information is not included (confidential or discriminatory)
(7) Access to report and data is granted according to rules presented in table 2.
